

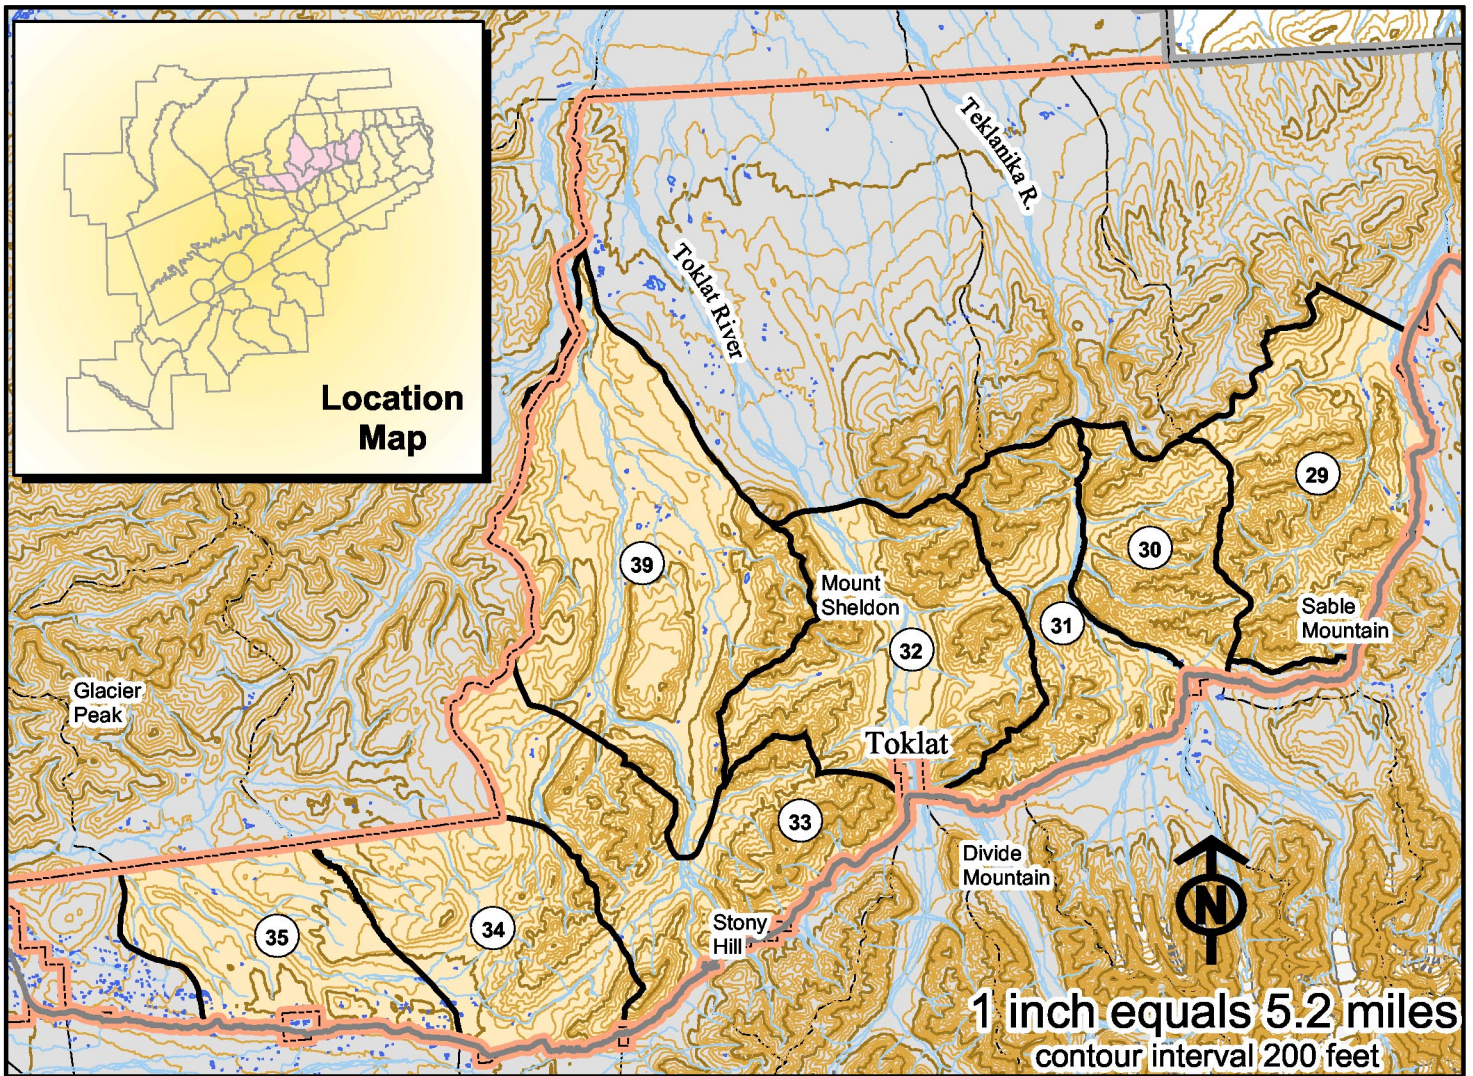

Map 2-29 (Units 29, 30, 31, 32, 33, 34, 35, and 39)

Sushana River, Lower East Fork, Lower Toklat, Southeast Stampede, Southwest Stampede (Unit 28, 37, 38, 62, 63)

Dry tundra and exposed rock high in the hills. Moist and wet tundra predominate at lower elevations while spruce, willow, and dwarf birch are found along the Sushana, Teklanika, and Toklat Rivers. Many raptor sites throughout southern regions. Wolf dens. Archeological sites in north section along the Teklanika River: listed on NRHP. There are 6 cabins. Includes one recent fire scar in unit 63. Unit 63 also contains part of the Lower Toklat, which is an anadromous stream. Winter trail along Stampede corridor and just south of Stampede corridor.

Since large rivers must be forded to get to this region, and because it is fairly removed from the road system it does not receive high levels of use. Excellent opportunities for solitude and natural quiet. Encounter rates are very low. Wilderness character is excellent.
